2. \*\*Open the file that you want to modify and place the image or a portion of the image within the open Photoshop document.\*\* Keep in mind that Adobe has achieved much fame with its intuitive user interface, and it is essential to start with a blank canvas. 3. \*\*Get comfortable by opening a few images in Photoshop to get a feel for the program.\*\* Practice with the use of various tools and learning to navigate and find items you want. 4. \*\*When you're confident with the program, you can make your first changes on the image.\*\* Be sure to save your work periodically in case you need to go back in later. For further information on creating a blank canvas in Photoshop click here. ## Editing in GIMP GIMP is a free and open source image manipulation program ( \*\*Figure 4\*\* ). It provides the same toolset that you would expect of an industry standard graphics program. It supports layers, transparency, and so on. \*\*Figure 4:\*\* GIMP provides many of the functions you would expect of a professional level image manipulation program. The GIMP interface is organized into toolbars that are right next to the image and contain all the tools you need to create and modify images. The default UI is very similar to the Windows interface, which is good for beginners because you can find where you need to go with minimal effort. The interface should look the same on a Mac. For further information on using GIMP, click here. ## Using Photoshop's Actions Actions are a tool that lets you automate repetitive tasks on a project. You can use Photoshop's actions panel ( \*\*Figure 5\*\* ) to create action sets that capture a button press or a mouse click, for example. The result is that you can fire off the same image editing task over and over. A good example is shooting hundreds of images on a tripod, where you press the shutter button and the action fires off a series of images. \*\*Figure 5:\*\* Photoshop allows you to create your own image editing actions. Actions can also be used to create textured texture backgrounds, for example. After creating a texture background, you can load the action into Photoshop to enhance the look of a brochure. Because Photoshop actions are customizable, you can use the action to create simple modifications to files, like shrinking a photo of the family and eliminating the background

1. Field of the Invention The present invention relates to a collimating device in a projection exposing apparatus and a projection exposing method for use in a lithographic apparatus. 2. Related Art A lithographic apparatus is a machine that applies a desired pattern onto a substrate, usually onto a target portion of the substrate. A lithographic apparatus can be used, for example, in the manufacture of integrated circuits (ICs). In that instance, a patterning device, which is alternatively referred to as a mask or a reticle, may be used to generate a circuit pattern to be formed on an individual layer of the IC ("individual layer" is also termed a "die" in the case of a wafer having a plurality of dies). This pattern may be transferred onto a target portion (e.g. comprising part of, one, or several dies) on a substrate (e.g. a silicon wafer). Transfer of the pattern is typically via imaging onto a layer of radiation-sensitive material (resist) provided on the substrate. In general, a single substrate will contain a network of adjacent target portions that are successively patterned. Known lithographic apparatus include steppers, in which each target portion is irradiated by exposing an entire pattern onto the target portion at one time, and scanners, in which each target portion is irradiated by scanning the pattern through a radiation beam in a given direction (the "scanning"-direction) while synchronously scanning the substrate parallel or anti-parallel to this direction. It is also possible to transfer the pattern from the patterning device to the substrate by imprinting the pattern onto the substrate. A lithographic apparatus is a tool used to manufacture a plurality of copies of an original pattern, defined by a patterning device. A lithographic apparatus can be used in photolithographic processes where, for example, an object is imaged onto a substrate or onto another patterning device. In both cases, the apparatus usually includes an illumination system or radiation source, a patterning device, a positioning device and a projection system. In the case of photolithographic processes, the substrate may comprise, for example, a glass plate, a quartz plate, or a metal plate. A projection system may be of the stationary type, in which the substrate may remain stationary during the irradiation, or of the scanning type, in which a substrate that is supported on a substrate holder is moved in an object plane defined by the projection system while the

Web services are communications between at least two devices over a network that uses communication protocols such as the Hypertext Transfer Protocol (HTTP). Web services can be classified as either RPC-based web services or REST-based web services. RPC-based web services provide a Remote Procedure Call (RPC) interface that can be used to invoke distributed, heterogeneous applications. REST-based web services implement the architectural style, which is based on the client-server model, and that is used to exchange messages between a client and a server. The REST style of web services is typically preferred because the communication is based on the HTTP protocol. The REST model is commonly used for accessing web services, because it provides well-defined protocols. REST-based web services are referred to herein as REST web services. Rest web services are described in detail in Section 5.1.3 of the Internet Engineering Task Force (IETF) Request for Comments (RFC) 2518, entitled "The Hypertext Transfer Protocol (HTTP) 1.1" ( which is incorporated herein by reference. The REST model provides access to the methods in the services. In general, REST services are accessed in a uniform manner. For instance, a request for a resource comprises a GET method, in which the caller specifies a resource identifier, such as a Uniform Resource Locator (URL). The server then responds with a payload that indicates either the intended state of the object or a status message, such as the result of the request. As noted above, REST web services provide access to the services. For instance, the public Internet has a collection of services, including a search engine, a weather service, and a financial services service, as well as online music services. However, while these services may be accessed via a REST-based web service, they are not accessible by conventional browsers that are employed on personal computers. To access such services, a different user interface, known as a browser, may be employed. For instance, a browser is commonly employed for viewing resources on a computer network, such as a LAN, and for viewing web pages, such as World Wide Web (WWW) pages. However, a browser is not well-suited for accessing an existing web service, such as a REST web service. A browser generally has a limited set of features and is not equipped to directly use the mechanisms provided by the services. Moreover, a browser is not configured
