I have a View that has a few large children that take up space, then within the view itself is something like 10 textboxes. I have implemented a "View.SizeChanged" handler to make the view size as big as it needs to be, but the problem is that the children can still cause scrollbars to appear on the side if they are large. I'd like to have a single function that is called whenever the size is changed for all child elements that can be determined to resize based on the size of the main view. This function would have to figure out which element is being resized by looking at the Name property. How do I implement this? Is there a built-in silverlight feature that would handle this sort of situation, or would I have to write something custom? A: I think what you are looking for is the dependency property. For the purpose you describe you can use SizeChanged. For the actual configuration, do as follows: Binding to your size value: (This setting is for example, and you may want to explore your options) SizeValue is the dependency property, so lets bind to it. public static readonly DependencyProperty SizeValueProperty = DependencyProperty.Register("SizeValue", typeof(double), typeof(MyView), new PropertyMetadata(new SizeChangedCallback(OnSizeChanged))); private static void OnSizeChanged(DependencyObject d, DependencyPropertyChangedEventArgs e) { var target = (MyView f678ea9f9e
